```

Visualization of Cross Correlation and Convolution with Matlab

1.2. Convolution in 2D

Filter (or Kernel)

- Modify or enhance an image by filtering
- Filter images to emphasize certain features or remove other features
- Filtering includes smoothing, sharpening and edge enhancement
- Discrete convolution can be viewed as element-wise multiplication by a matrix

1	1 _{x1}	1 _{x0}	0 _{x1}	0
0	1 _{x0}	1 _{x1}	1 _{x0}	0
0	0 _{x1}	1 _{x0}	1 _{x1}	1
0	0	1	1	0

Feature

2. Convolutional Neural Networks (CNN)

2.1. Motivation

The bird occupies a local area and looks the same in different parts of an image. We should construct neural networks which exploit these properties.

- Generic structure of neural network
 - does not seem the best
 - did not make use of the fact that we are dealing with images
 - no regularization

- **Locality:** objects tend to have a local spatial support
 - fully-connected layer → locally-connected layer

- **Translation invariance:** object appearance is independent of location
 - Weight sharing: units connected to different locations have the same weights

Object Size?

2.2. Convolutional Operator

Matrix multiplication

- Every output unit interacts with every input unit

Convolution

- Local connectivity
- Weight sharing
- Typically have sparse interactions

Deep Artificial Neural Networks

- Complex function approximator
 - Simple nonlinear neurons
 - Linear connected networks
- Hidden layers
 - Autonomous feature learning

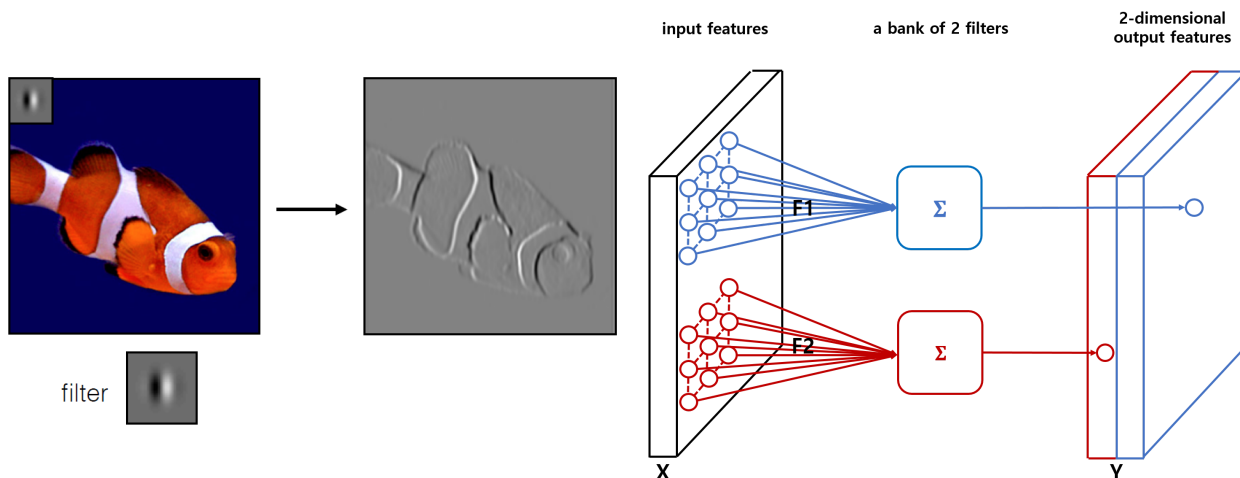

Convolutional Neural Networks

- Structure
 - Weight sharing
 - Local connectivity
- Optimization
 - Smaller searching space

Convolutional Neural Networks

- Simply neural networks that use the convolution in place of general matrix multiplication in at least one of their layers
- The convolution can be interpreted as an element-wise matrix multiplication

2.3. Nonlinear Activation Function

2.4. Pooling

- Compute a maximum value in a sliding window (max pooling)
 - Reduce spatial resolution for faster computation
 - Achieve invariance to local translation
- Pooling size : 2×2

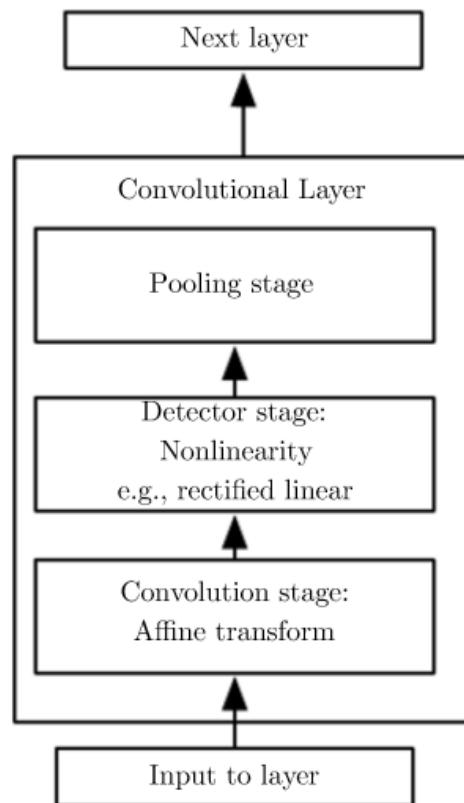

- Max pooling introduces invariances

2.5. Inside the Convolution Layer

- First, the layer performs several convolutions to produce a set of linear activations
- Second, each linear activation is running through a nonlinear activation function
- Third, use pooling to modify the output of the layer further

3. Lab: CNN with TensorFlow

- MNIST example
- To classify handwritten digits

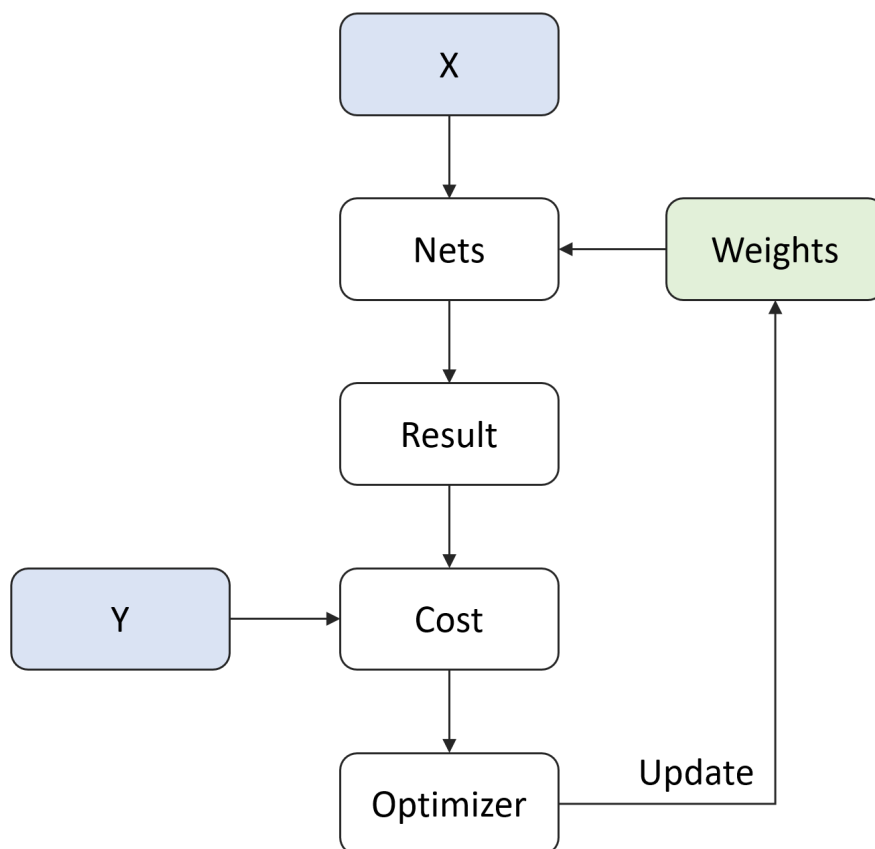

```

Iterative Optimization Flow

3.1. Import Library

```
In [8]: # Import Library
import numpy as np
import matplotlib.pyplot as plt
import tensorflow as tf
```

C:\ProgramData\Anaconda3\lib\site-packages\h5py__init__.py:34: FutureWarning: Conversion of the second argument of issubdtype from `float` to `np.float` is deprecated. In future, it will be treated as `np.float64 == np.dtype(float).type`.
from ._conv import register_converters as _register_converters

3.2. Load MNIST Data

- Download MNIST data from the tensorflow tutorial example

```
In [9]: from tensorflow.examples.tutorials.mnist import input_data
mnist = input_data.read_data_sets("MNIST_data/", one_hot=True)
```

Extracting MNIST_data/train-images-idx3-ubyte.gz
Extracting MNIST_data/train-labels-idx1-ubyte.gz
Extracting MNIST_data/t10k-images-idx3-ubyte.gz
Extracting MNIST_data/t10k-labels-idx1-ubyte.gz

```
In [10]: # Check data
train_x, train_y = mnist.train.next_batch(10)
img = train_x[9,:].reshape(28, 28)

plt.figure(figsize=(5, 3))
plt.imshow(img, 'gray')
plt.title("Label : {}".format(np.argmax(train_y[9])))
plt.xticks([])
plt.yticks([])
plt.show()
```

Label : 7

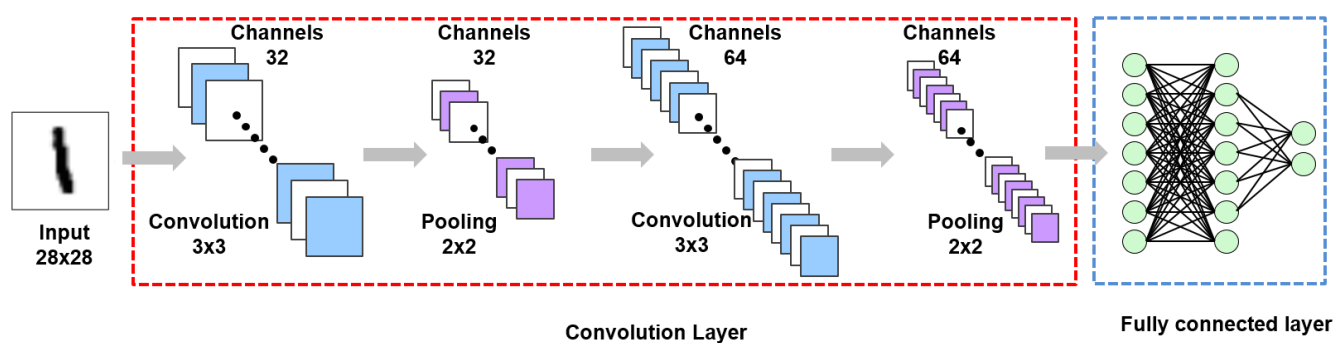

3.3. Build a Model

Convolution layers

- First, the layer performs several convolutions to produce a set of linear activations
- Second, each linear activation is running through a nonlinear activation function
- Third, use pooling to modify the output of the layer further

Fully connected layers

- Simple multi-layer perceptrons

First, the layer performs several convolutions to produce a set of linear activations

- Filter size : 3×3
- Stride : The stride of the sliding window for each dimension of input
- Padding : Allow us to control the kernel width and the size of the output independently
 - 'SAME' : zero padding
 - 'VALID' : No padding

```
conv1 = tf.nn.conv2d(x, weights['conv1'], strides= [1,1,1,1], padding = 'SAME')
```

Second, each linear activation is running through a nonlinear activation function

```
conv1 = tf.nn.relu(tf.add(conv1, biases['conv1']))
```

Third, use a pooling to modify the output of the layer further

- Compute a maximum value in a sliding window (max pooling)

- Pooling size : 2×2

```
maxp1 = tf.nn.max_pool(conv1,
                        ksize = [1, p1_h, p1_w, 1],
                        strides = [1, p1_h, p1_w, 1],
                        padding = 'VALID')
```

Fully connected layer

- Input is typically in a form of flattened features
- Then, apply softmax to multiclass classification problems
- The output of the softmax function is equivalent to a categorical probability distribution, it tells you the probability that any of the classes are true.

```
output = tf.add(tf.matmul(hidden1, weights['output']), biases['output'])
```

3.4. Define a CNN's Shape

```

In [11]: input_h = 28 # Input height
         input_w = 28 # Input width
         input_ch = 1 # Input channel : Gray scale
         # (None, 28, 28, 1)

         ## First convolution layer
         # Filter size
         k1_h = 3
         k1_w = 3
         # the number of channels
         k1_ch = 32
         # Pooling size
         p1_h = 2
         p1_w = 2
         # (None, 14, 14 ,32)

         ## Second convolution layer
         # Filter size
         k2_h = 3
         k2_w = 3
         # the number of channels
         k2_ch = 64
         # Pooling size
         p2_h = 2
         p2_w = 2
         # (None, 7, 7 ,64)

         ## Fully connected
         # Flatten the features
         # -> (None, 7*7*64)
         conv_result_size = int((28/(2*2)) * (28/(2*2)) * k2_ch)
         n_hidden1 = 100
         n_output = 10

```

3.5. Define Weights, Biases and Network

- Define parameters based on predefined layer size
- Initialize with normal distribution with $\mu = 0$ and $\sigma = 0.1$

```
In [12]: weights = {
    'conv1' : tf.Variable(tf.random_normal([k1_h, k1_w, input_ch, k1_ch],std
dev = 0.1)),
    'conv2' : tf.Variable(tf.random_normal([k2_h, k2_w, k1_ch, k2_ch],stddev
= 0.1)),
    'hidden1' : tf.Variable(tf.random_normal([conv_result_size, n_hidden1],
stddev = 0.1)),
    'output' : tf.Variable(tf.random_normal([n_hidden1, n_output], stddev =
0.1))
}

biases = {
    'conv1' : tf.Variable(tf.random_normal([k1_ch], stddev = 0.1)),
    'conv2' : tf.Variable(tf.random_normal([k2_ch], stddev = 0.1)),
    'hidden1' : tf.Variable(tf.random_normal([n_hidden1], stddev = 0.1)),
    'output' : tf.Variable(tf.random_normal([n_output], stddev = 0.1))
}

x = tf.placeholder(tf.float32, [None, input_h, input_w, input_ch])
y = tf.placeholder(tf.float32, [None, n_output])
```

```
In [13]: # Define Network
def net(x, weights, biases):
    ## First convolution layer
    conv1 = tf.nn.conv2d(x, weights['conv1'],
                        strides= [1, 1, 1, 1],
                        padding = 'SAME')
    conv1 = tf.nn.relu(tf.add(conv1, biases['conv1']))
    maxp1 = tf.nn.max_pool(conv1,
                        ksize = [1, p1_h, p1_w, 1],
                        strides = [1, p1_h, p1_w, 1],
                        padding = 'VALID'
                        )

    ## Second convolution layer
    conv2 = tf.nn.conv2d(maxp1, weights['conv2'],
                        strides= [1, 1, 1, 1],
                        padding = 'SAME')
    conv2 = tf.nn.relu(tf.add(conv2, biases['conv2']))
    maxp2 = tf.nn.max_pool(conv2,
                        ksize = [1, p2_h, p2_w, 1],
                        strides = [1, p2_h, p2_w, 1],
                        padding = 'VALID')

    # shape = conv2.get_shape().as_list()
    # maxp2_re = tf.reshape(conv2, [-1, shape[1]*shape[2]*shape[3]])
    maxp2_re = tf.reshape(maxp2, [-1, conv_result_size])

    ### Fully connected
    hidden1 = tf.add(tf.matmul(maxp2_re, weights['hidden1']), biases['hidden
1'])
    hidden1 = tf.nn.relu(hidden1)
    output = tf.add(tf.matmul(hidden1, weights['output']), biases['output'])
    return output
```

3.6. Define Loss, Initializer and Optimizer

Loss

- Classification: Cross entropy
 - Equivalent to apply logistic regression

$$-\frac{1}{N} \sum_{i=1}^N y^{(i)} \log(h_{\theta}(x^{(i)})) + (1 - y^{(i)}) \log(1 - h_{\theta}(x^{(i)}))$$

Initializer

- Initialize all the empty variables

Optimizer

- GradientDescentOptimizer
- AdamOptimizer: the most popular optimizer

In [14]: LR = 0.0001

```
pred = net(x, weights, biases)
loss = tf.nn.softmax_cross_entropy_with_logits(labels=y, logits=pred)
loss = tf.reduce_mean(loss)

# optimizer = tf.train.GradientDescentOptimizer(learning_rate).minimize(cost)
optm = tf.train.AdamOptimizer(LR).minimize(loss)

init = tf.global_variables_initializer()
```

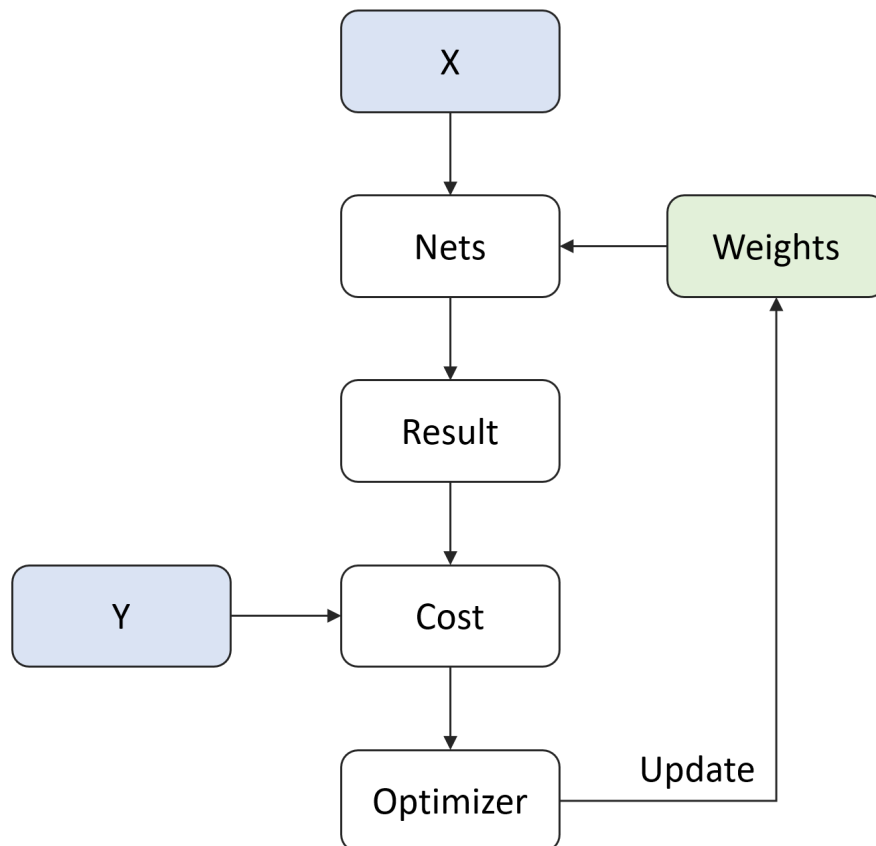

WARNING:tensorflow:From <ipython-input-14-47eac4d27335>:4: softmax_cross_entropy_with_logits (from tensorflow.python.ops.nn_ops) is deprecated and will be removed in a future version.

Instructions for updating:

Future major versions of TensorFlow will allow gradients to flow into the labels input on backprop by default.

See `tf.nn.softmax_cross_entropy_with_logits_v2`.

3.7. Summary of Model

3.8. Define Configuration

- Define parameters for training CNN
 - `n_batch` : batch size for stochastic gradient descent
 - `n_iter` : the number of training steps
 - `n_prt` : check loss for every `n_prt` iteration

```
In [15]: n_batch = 50  
         n_iter = 2500  
         n_prt = 250
```

3.9. Optimization

```
In [16]: # Run initialize
# config = tf.ConfigProto(allow_soft_placement=True) # GPU Allocating polic
y
# sess = tf.Session(config=config)
sess = tf.Session()
sess.run(init)

# Training cycle
for epoch in range(n_iter):
    train_x, train_y = mnist.train.next_batch(n_batch)
    train_x = np.reshape(train_x, [-1, input_h, input_w, input_ch])
    sess.run(optm, feed_dict={x: train_x, y: train_y})

    if epoch % n_prt == 0:
        c = sess.run(loss, feed_dict={x: train_x, y: train_y})
        print ("Iter : {}".format(epoch))
        print ("Cost : {}".format(c))
```

```
Iter : 0
Cost : 2.483252763748169
Iter : 250
